

1•VIEW

Java Installation

Windows Platform

1. Introduction

This document describes the installation of Java Runtime Environment (JRE) required by all OneView components.

1.1 Supported Java Versions

OneView components require Java version 11 or higher. In production environments Monsalta recommends using version 11 because it has Long Term Support (LTS).

Only OpenJDK implementations of Java are supported by Monsalta, although licensed Oracle builds should work as well.

Please be aware that LTS builds are NOT available for download from openjdk.java.net. Instead Monsalta recommends using free LTS builds downloadable from <https://adoptopenjdk.net/>.

1.2 Java Installation

- 1) Download latest ZIP-file build of OpenJDK version 11 (64-bit).
The latest supported version tested by Monsalta is available for download from <https://www.monsalta.com/oneview>.
- 2) Unzip the file to a directory of your choice.
Monsalta recommends creating a folder "OpenJDK" in the root directory of your OneView installation (e.g.: 'C:\OneView\OpenJDK')

1.3 Installing OneView Components

Once Java has been installed refer to the documentation for each component to finalize the installation.
